composite materials in maritime pdf

composite materials in maritime structures volume 2 practical considerations The evolution of composite material boat construction has created the need to evaluate the basic design tools that are used to create safe marine structures. As materials and building practices improve, it is not unreasonable to consider composite construction for vessels up to 100 meters (approx 330 feet).

composite materials in maritime structures volume 2 practical considerations Most composites are made of just two materials. One is the matrix or binder. It surrounds and binds together fibres or fragments of the other material, which is called the reinforcement. Modern examples The first modern composite material was fibreglass. It is still widely used today for boat hulls, sports equipment, building panels and many car bodies.
